Prototype link (Figma)
- **PlayFigma**
- **Figma**

The reason for selecting our design

We chose this design because we thought that it would be easier for users to use our primary task through the paper prototype. This prototype was much more accessible and there were no unnecessary steps. Also, it can show a lot of information at once, so users can easily check information and get social matching or information for dogs.

User Testing (Brief)

- **User testing methods**

  We found 3 people in total who had dogs around us then set a date and time, and asked for an online Zoom meeting. We gave a Figma link and checked the users using our app.The user testing process took about 20 minutes per person including the survey. During testing, the user's feedback was immediately recorded in the note.
  User's demographics:
  Session1) Name : Ina Choi / Occupation: student intern / Dog owner: Yes / Breed of dog: Maltese
  Session2) Name : Bia Lee / Occupation: student / Dog owner: Yes / Breed of dog: Pomeranian
  Session3) Name : Heejoon Hwang / Occupation: University student / Dog owner: Yes / Breed of dog: Doberman

- **User testing results(key findings from the testing):**
  - Typo
  - Editing and deleting functions.
  - posting images. (unable to see the images that they selected)
  - the number of comments. (cannot see the number of comments on the post)
  - Matching form (give instructional phrase)
  - "Select the type of dog you want" was not clearly understood.
  - Misunderstood of selecting one of the two photos on the screen that was displayed during matching.
  - Congrat pop-up => user could want to continue matching.
  - Add the function to leave the chat room while chatting.

List of changes our team expects to make for the actual implementation:

- Revise the bottom right pencil button in the community page and make sure to navigate when clicking that button
- Write instructions about filling the matching form in detail and clearly.
- When matching is completed, the user can start chatting or keep swiping to see other users.
- Since users are confused about what to swap (profile image or O X icons) on the matching profile screen, clarify the layout of the matching profile**.**
- Add deleting and editing functions on the posting page.

Class note from the in-class activity on April 20, 2022

Community

- Thinks it's better **to put the CREATE button outside the main page** rather than putting it inside each section of categories.
- Asked for the functionality which **shows the total number of comments for each post**.
- When uploading the image while making comments for the post, it would be more efficient to make the functionality that enables the users **to see which image they selected** and therefore which they will try to upload.

Chat

- Would be more distinguishable if we **differentiate the user layout and dog layout in the profile screen**.
- Would be nice to **implement the case of providing the photos when a user has more than 1 dog**.
- Would be nice to also **show the photo of the user in a small size** in the bottom of the dog photo just to recognize.

=> Overall, make the **dog as a main profile image** and put the user profile image as extra information. (Dog > Person)
